## BCSFA Sea Lice Monitoring Results

Salmon farms report lice levels on all farms within specific fish health zones/areas as part of the Sea Lice Management Strategy 2004. Monitoring began in October 2003.

In British Columbia, lice from wild salmon returning from the ocean to spawn can result in an increase in the levels of lice on fish farms in the fall and early winter. Veterinarians treat these fish to reduce lice levels.

The program uses internationally accepted standards for sea lice monitoring.

## Atlantic Salmon Farms

For each zone there is a graph for salmon one year or less in seawater (year class 1) and another for salmon two years or more in seawater (year class 2). All graphs are in .pdf format.
