BC HYDRO PEACE RIVER BASELINE TEMPERATURE MONITORING

YEAR 8 SUMMARY – APRIL 2016 to March 31, 2017

Date: August 31, 2017

Attention: Dave Hunter
Senior Environmental Coordinator, Site C
BC Hydro
Burnaby, BC

Since 2008, Diversified Environmental Services (DES) has maintained an array of Tidbit v2 Model #UTBI-001 temperature sensor/logger units in the Peace River as part of the BC Hydro Peace River Water Use Plan (WUP). The program has involved the monitoring of water temperature at 18 stations between the WAC Bennett Dam forebay (Williston Reservoir), and a point on the Peace River located 6.5 km downstream of the Pine River confluence (Fig. 1). In April 2016, at the request of the Site C project, 6 temperature loggers were added at 3 additional monitoring sites in the project area. Two loggers were deployed along the left downstream bank of the lower Pine River mainstem (pineMS1 and pineMS2), 2 loggers were deployed along the left downstream bank of the lower Beatton River mainstem (beatMS1 and beatMS2), and 2 loggers were deployed on the left and right downstream banks of the Peace River, upstream of its confluence with the Pouce Coupe River (pouceUP1 and pouceUP2).

The following sections provide a summary of site locations and methods used to deploy, maintain and download temperature loggers at the original WUP monitoring stations and the additional Site C stations. Logger locations and details appear in Figure 1 and Table 1.

Monitoring stations are typically maintained in pairs at each general location in order to minimize the risk of data gaps in the event of logger stranding, failure, or loss. At Peace River

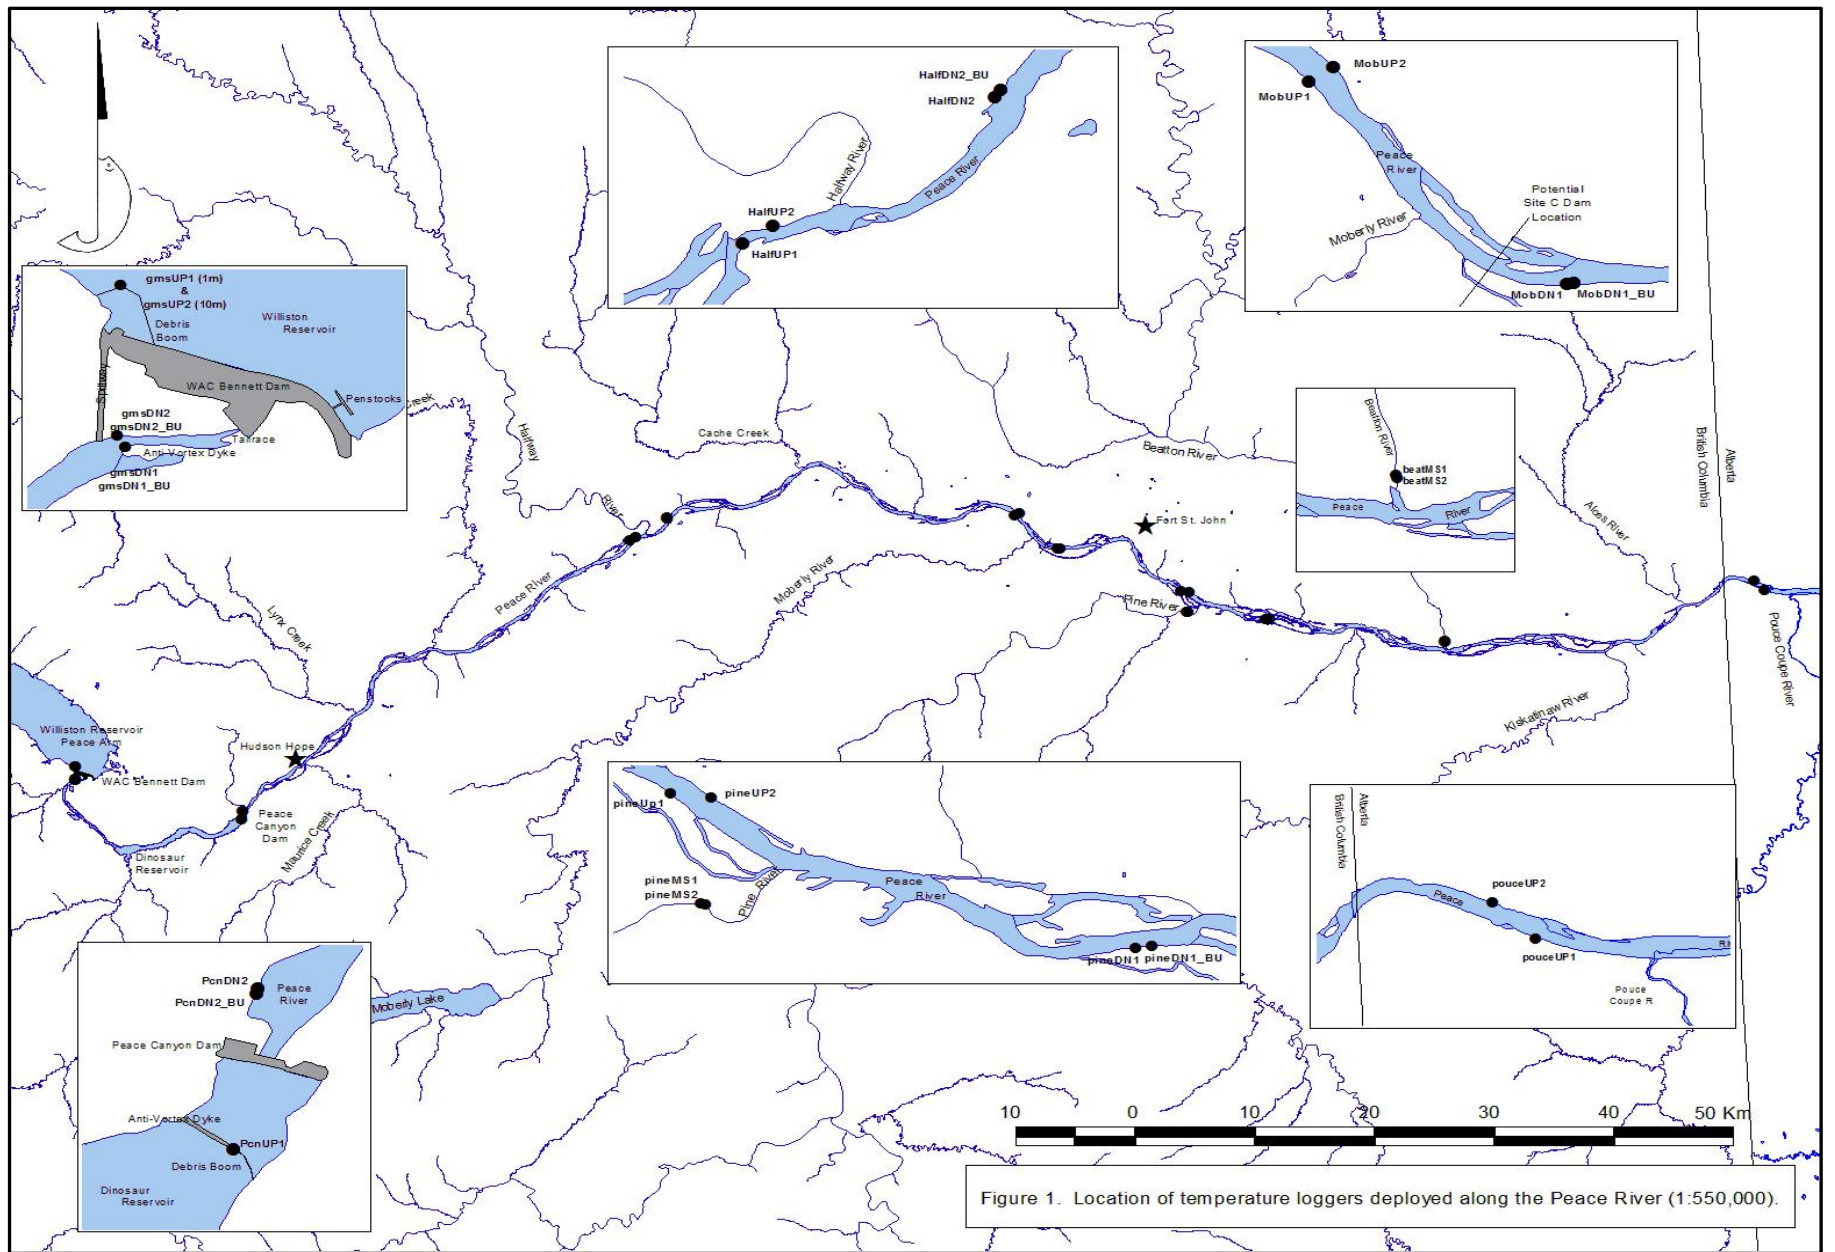

Table 1. Temperature monitoring station location information as of April 30, 2017.

locations upstream of major tributaries (Halfway, Moberly, Pine, and Pouce Coupe rivers), monitoring stations are maintained on opposing banks of the river in order to provide redundancy and confirm temperature consistency across the channel. At locations in and downstream of major tributaries, paired stations are maintained on common banks in order to provide better redundancy in tributary outflow paths prone to stranding by passing ice and debris.

Temperature loggers were programmed to record water temperature (°C) at 1 hour intervals. Loggers were housed in 38 mm x 100 mm steel nipples with threaded steel end caps, weighted with 5 kg steel anchors, and tethered to rooted trees using 3.18 mm stainless steel cable.

Temperature data recorded and stored on each logger during 2016/17 were downloaded at approximately 3 month intervals by field transfer to a Model U-DTW-1 Hobo® waterproof optical shuttle (Onset Corp., Bourne, MA). Data from the shuttle were then downloaded to a desktop computer after each field session.

Logger sites at the WAC Bennett Dam and Peace Canyon Dam forebay and tailrace locations were accessed by vehicle, while all Peace River and tributary sites were accessed by riverboat. Conditions and observations at the time of each download event were documented in the field on hardcopy Download Information Forms and subsequently entered into digital format. *In situ* reference temperatures were recorded at the time of each field download event using a YSI® Professional Plus handheld multi-parameter instrument (Model No. E-528-ProPlus) or certified laboratory-grade mercury thermometer calibrated in increments of 0.1°C for comparison to the corresponding hourly logger readings (within 30 minutes of reference temperature; Appendix I).

Data files were exported as MS Office Excel and Access compatible text files using Onset® Hoboware Pro software (Ver. 2.3.0) and amalgamated into single Excel worksheets for each data logger.

Some logistical problems were encountered during Year 8. Occasional stranding of loggers above the waterline during Year 8 was largely associated the accumulation of debris on tether cables during tributary freshet and during flood events in late June and August 2016. Loggers located downstream of the Pine and Moberly river confluences were stranded in late June to early July by debris originating from upstream. The loggers located upstream of the Halfway River (halfUP2) and Moberly River (mobUP2) were pulled ashore and left near or above the high water mark by persons unknown.

During the October 2016 and January 2017 download sessions, 3 data files were corrupted during the download and transfer process. The problem was attributed to an intermittent glitch in Hobo optical shuttle and the unit was replaced.

During the April 2016 download, both loggers suspended from the debris boom buoy in the WAC Bennett Dam forebay were discovered missing. It was believed the tether cable had been pinched and parted by a shifting boom line clevis and the arrangement was modified to prevent similar loss of the replacement loggers. One logger located upstream of the Moberly River (mobUP2) and one located downstream of the Pine River (pineDN1-BU) could not be recovered during the July 2016 download session, which occurred immediately after the major flood event in late June 2016. All 4 loggers were replaced during the July download.

Reference temperatures recorded during download events are presented in Appendix I along with corresponding logger temperatures and indicated error values. None of the loggers in use in 2016/17 exhibited a correctable zero error greater than 0.3°C; most calibration errors were typically within the range of 0.2°C.

Several loggers were replaced in Year 8, as they were approaching the end of their predicted lifespan of six years or were recording low voltage readings.

A summary of temperature data collection results and related conditions and limitations are discussed in the following 8 sections, which correspond to the 8 generating station and tributary features. Download Information Forms completed during each download are provided in Appendix II.

WAC Bennett Dam Forebay and Tailrace

The WAC Bennett Dam forebay temperature monitoring station is located at the GMS spillway log boom and consists of a vertical cable suspended from the northernmost log boom steel buoy. Temperature is recorded with 2 loggers, the first located at 1 m depth (gmsUP1) and the second suspended at a depth of 10 m (gmsUP2). The forebay station could not be accessed during the January 2016 download session due to hazardous ice conditions and both loggers were irretrievably lost due to a parted cable prior to the April 2016 download session. As a result, only temperature data spanning April 11 to December 31, 2016 could be recovered. Although seasonal thermal stratification of Williston Reservoir is evident, the relatively small temperature differential between the 2 loggers (mean=0.4°C) suggests the primary thermocline may lie deeper than 10 m. Maximum

temperature differentials up to 6.5°C were recorded during a period of significant daytime surface warming during the last two weeks of July and first two weeks of August, when annual ambient temperatures peaked. Temperature profiles recorded further up the Peace Reach during unrelated work in August 2012 indicated a thermocline at approximately 26 m depth (B. Culling, pers. obs.).

The GMS tailrace monitoring sites are located on opposite banks, approximately 700 m downstream of the outflow manifolds. Logger gmsDN1 records the temperature of water flowing from the south tailrace manifold, which originates from the shallowest penstock depth. Logger gmsDN2 samples water from the north tailrace manifold, which originates from a deeper withdrawal point. The tethered steel capsule at both stations contains a back-up logger in addition to the primary unit (gmsDN1BU and gmsDN2BU). All 4 loggers collected seamless data through Year 8.

As in previous years, water temperatures at gmsDN2 showed the lowest annual variation and are consistently cooler in the summer and warmer in the winter than gmsDN1 flow, which originates closer to the surface of Williston Reservoir. Temperatures recorded at gmsUP1 (forebay surface) exhibit greater annual variation than tailrace values. Temperatures recorded at gmsDN1 and gmsDN2 exhibit a wide range of hourly and daily fluctuations during the summer period compared to gmsUP1, due to operational changes in water intake for power generation and maintenance activities.

Peace Canyon Dam Forebay and Tailrace

The data logger recording temperature at the Peace Canyon Dam forebay (pcnUP1) is attached to the anti-vortex dam log boom, located approximately 450 m upstream of the dam face. The pcnUP1 data file for the period between November 1 and December 31, 2016 was corrupted by a faulty optical shuttle during the January 4, 2017 download and could not be recovered. Temperature data is available for the remainder of the year (January 1 to October 31).

Both Peace Canyon Tailrace loggers (pcnDN2 and pcnDN2BU) recorded continuous data throughout Year 8. A comparison of PCN tailrace temperature (pcnDN2) and GMS tailrace temperature (mean of gmsDN1 and gmsDN2) indicates a relatively small temperature change through Dinosaur Reservoir during all seasons. For example, mean differentials of 0.02°C were recorded in winter (December through February) and 0.5°C in summer (June through August). Slight thermal stratification of the Peace Canyon forebay associated with peak ambient temperatures during the last week of June and first week of July and again during the first week of August 2016 was evident.

Halfway River Confluence

Peace River water temperature was monitored at points approximately 1 km upstream and 2.5 km downstream of the Halfway River confluence. Halfway upstream stations were maintained on opposing banks throughout Year 8 (halfUP1 and halfUP2). Data sets from both upstream loggers for the period between October 10 and December 31 were corrupted by a faulty optical shuttle during the January 4, 2017 download and could not be recovered. Logger halfUP1 recorded continuous data for the remainder of the year (January 1 to October 10), however, logger halfUP2 became intermittently stranded during periods of low water between April and October after being pulled partially to shore by curious persons prior to both the July 7 and October 10 download sessions. No cross-channel differential was recorded between the opposing upstream stations.

Both Halfway downstream loggers (halfDN2 and halfDN2BU) were located on the left downstream bank within the influence of Halfway River inputs. Both were intermittently exposed during Year 8, resulting in sporadic gaps in water temperature readings. Logger halfDN2BU was swung into shallow water by debris from the Halfway River sometime between July 15 and October 5, 2016 and recorded air temperature during periods of low flow. Logger halfDN2 appeared to have been pulled to shore by persons unknown sometime after the October 10, 2016 download.

As in previous years, Peace River temperature values recorded at stations upstream and downstream of the Halfway River confluence differed markedly. Temperatures collected downstream of the confluence exhibited a greater degree of daily and annual variability. Halfway River inputs typically have a cooling effect during the winter period (October through April) and a warming effect during the summer (May through September). Temperatures within the Halfway River mainstem upstream of its confluence with the Peace are not recorded as part of this project.

Moberly River Confluence

Peace River water temperature was monitored at points approximately 2.6 km upstream and 2.5 km downstream of the Moberly River confluence. Upstream stations were maintained on opposing banks throughout Year 8 (mobUP1 and mobUP2). Logger mobUP1 recorded continuous water temperature data throughout Year 8. Logger mobUP2 was lost between April and July 2016, due to a parted cable, and could not be recovered during the July 7 download attempt. A slight cross-channel differential averaging 0.5°C was recorded between July 7 and August 31, 2016.

The Moberly downstream logger and downstream back-up logger are both located on the south bank of the Peace River, within the influence of outfall from the Moberly River. Both loggers also lie immediately downstream of the footprint of the proposed Site C dam. No water temperature data is available from either logger between January 1 and 27, 2016 as both units were destroyed by Site C construction preparation activities in December 2015; both were replaced on January 27, 2016. Between February and April 2016 both mobDN1 and mobDN1BU were swung to shore by ice and debris and became exposed frequently during low water levels. Seamless data was collected after the April 15, 2016 download.

As in previous years, Peace River temperatures recorded within the influence of the Moberly River (downstream of confluence), were cooler than the upstream stations from January through March and warmer than the upstream stations from May through July. The influence of the Moberly River is significantly less than that of the Halfway River and appears to correspond to the difference in relative contributed volumes. Temperatures within the Moberly River upstream of its confluence with the Peace River are not recorded as part of this project.

Pine River Confluence

Peace River water temperature was monitored at points approximately 2.0 km upstream and 6.5 km downstream of the Pine River confluence. During Year 8, upstream stations were maintained on opposing banks (pineUP1 and pineUP2) and both downstream loggers (pineDN1 and pineDN1BU) were located on the south river bank, within the influence of inputs from the Pine River.

Both pineUP1 and pineUP2 loggers recorded continuous hourly data throughout Year 8. No cross-channel differential was noted.

Both Pine downstream loggers (pineDN1 and pineDN1BU) exhibited periodic data gaps as a result of unusually high debris flow from the Pine River during 2016. Logger pineDN1 was partially swung to shore by debris prior to the April 2016 download and was re-tethered in a new location in an attempt to minimize the frequency of debris accumulation on the tether cable. Despite this revision, the logger was dislodged by debris and swung to shallow water again prior to the July and October 2016 and January 2017 downloads. As a result, air temperatures were recorded

during sporadic periods of low water. Logger pineDN1BU was lost to large debris during a flood event in late June 2016 and was replaced on July 13, 2016.

Temperature values recorded within the downstream influence of the Pine River were typically cooler than the Pine River upstream stations from late September through December and slightly warmer from July through mid-September.

Pine River Mainstem

Temperature loggers in the Pine River mainstem were initially installed on April 15, 2016 at right (pineMS1) and left (pineMS2) downstream bank locations. A major flood event on June 16-18, 2016 resulted in the loss of logger pineMS1 prior to the July download. The logger was replaced on July 13 and relocated to the opposite bank where it was anchored to a remnant steel piling.

Both Pine River loggers were successfully downloaded on October 13, 2016 but could not be accessed during the January 2017 download event due to heavy ice cover. Data recorded since October 13, 2016 were successfully recovered from both loggers during the April 27, 2017 download. The data suggests that logger pineMS2 was swung to shore and stranded by ice flow on April 15, just prior to the April 27 download. Both loggers are currently located approximately 1.3 km upstream of the confluence with the Peace River.

Beatton River Mainstem

Temperature loggers in the lower Beatton River mainstem (beatMS1 and beatMS2) were initially installed on April 15, 2016 on the left downstream bank. Debris flow associated with the June 16-18, 2016 flood event dislodged both Beatton loggers, stranding beatMS1 above the normal water level. Logger beatMS2 was swung to shore but remained within the wetted perimeter of the river. Both loggers were downloaded on July 7, 2016.

Logger beatMS1 was lost to heavy debris flow in a second flood event in late August 2016 and could not be recovered during the October download event. The logger was replaced and anchored more securely to a large tree further back from the river bank. Logger beatMS2 was also dislodged by debris and found stranded on shore above the water line during the October 13 download event. Data downloaded from beatMS2 on October 13 was corrupted by a faulty optical shuttle, which has since been replaced.

Neither logger beatMS1 nor beatMS2 could be accessed during the January 2017 download event due to heavy ice cover. The anchor cables of both loggers were subsequently parted by moving ice during spring break-up and neither could be located during the April 2017 download event. As a result, only data spanning the April 15 to July 7, 2016 period are available for the Beatton River mainstem.

Both loggers were replaced on April 28, 2017 and their tethers were upgraded to 12.7 mm steel cable. Logger beatMS2 was redeployed at its original location and logger beatMS1 was repositioned further upstream. The Beatton mainstem loggers are currently located approximately 0.6 km and 1.0 km upstream from the confluence with the Peace River. Given the recurring difficulties associated with debris flow and extreme flow fluctuations at the Beatton River mainstem sites, more frequent inspections and downloads are planned for 2017/18.

Peace River Upstream of Pouce Coupe River

Temperature loggers in the Peace River mainstem upstream of the Pouce Coupe River confluence (pouceUP1 and pouceUP2) were initially installed on April 15, 2016. No logistical issues were encountered at either site and both loggers were successfully downloaded on July 6 and October 12, 2016 and January 18 and April 15, 2017. The pouceUP1 and pouceUP2 stations are currently located 2.4 km and 3.3 km upstream of the confluence with the Pouce Coupe River, respectively.

APPENDIX I
